Subject:

Rush search for 09/499,662

The case is due this bi-week. Would you please approve rush search for SEQID No:107 and 117? Thank you.

Examiner Misook Yu, Ph.D. 703-308-2454 (Phone) Art Unit 1642 CM1-8E18 (Room) CM1-8E12 (Mail Box)

chain of mutine anti-human Features and antibody HFETA.

Humanisation of the murine sequence (see AAN83042) entailed making DIE, P47A, K49R, H80S, P81R, V82L, E84P, A87F, T89V and R107K amino acid substitutions; these residues are conserved in the human light chain (kappa chain). Host cell Escherichia coli pHSH5 SANK 7039B harbors plasmid pHSHH5 carrying a fusion fragment of the humanised PBHH type HFETA light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERW BP-6274 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFETA (see AAN8301-37), like native HFETA, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal metastions, and also to tracat such diseases, including autoimmune interactions, and also to tracat such diseases, including autoimmune gaft versus host disease, Siogram syndrome, pernicious anaemia, disease, rheumatoid arthritis, autoimmune haemolytic anaemia, disease, rheumatoid arthritis, autoimmune haemolytic anaemia, disease, rheumatoid arthritis, autoimmune haemolytic anaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thromobenia burpura and insulin-dependent disbetes), allergies, attopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis. myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antibodies and proteins bind conserved epitope of Fas antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of the PDHH type humanised light
                                                                                                                                                                                                                                                                                                                                                                                                                                    Jun O, Kimihisa I;

Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody

Claim 20; Page 101; 139pp; Japanese.

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HPETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Wis its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephitis, aplastic anaemia (pannyaelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AABI4772-B14774 and AABI4777-B14777 represent the light chains of several humanised HFE7A-derived anti-Fas

The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antishteumatic, nephrotropic, antilnfertility, neuroprotective, antistreniosclerotic, cardiant and hepatropic activity. (I) induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, remark at specially systemic upon sort disease, Siorgen's syndrome, pernicious or hypoplastic versus host disease, Siorgen's syndrome, pernicious or hypoplastic canemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenta gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin candiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively calling apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody HEFFA designed light chain which is used in the method described in the Invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 QQKPGQAPRLLIYAASNLESGIPDRFSGSGSGTDFTLTISRLEPEDFAVYYCQQSNEDPR 120

This is the amino acid sequence of the HH type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AARB3042) entailed making b47A, K49R, H80S, P81R, V82L, E84P, E85A, A87F and T89V amino acid substitutions; these residues are conserved in the human light chain (kappa chain). Host cell Escherichia coli pHSGHH7 SANK 73497 HT type HFE7A light chain and DNA encoding the region of humanised immunoglobulin kappa chain, and is deposited as FERM BP-6073 antibodies by culturing host cells. Humanised versions of HEF7A (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HEF7A (secentaring the provides methods for producing the methods for inducting the methods for seabable of inducting the provides methods for provide

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (pannyalophthisis), hepatitis, AIDS and organ graft rejection. Sequences ABBH4772-BH4774 and ABBH4777-BH4778 represent the light chains of several humanised HFE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains

The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New humanized anti-Fas antibody, useful for treating or preventing e.g.

immunomodulatory, dermatological, immunosuppressive, thyromimetic, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic contents, hashimoto disease, remarked arthritis, graft versus host disease, Slorgen's syndrome, perincious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin cependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminat, chronic, viral to C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-murine antibody response. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ÷
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 QQKPGQAPRLLIYAASNLESGIPDRFSGSGSGTDFTLTISRLEPEDFAVYYCQQSNEDPR 120

This is the amino acid sequence of the PDHM type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AAM83042) entailed making D1E, P47A, K49R and R107K amino acid substitutions; these residues are conserved in the human light (kappa) chain. Host call Escherichia coli pHSHMZ SANK 70198 harbors plasmid pHSHMZ carrying a fusion of the humanised apply type HFE7A light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERN BP-6272 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease, stemandscase, permitcious anaemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, rheumachid arthritis, autoimmune haemolytic anaemia, collising the models of the collision of disease, scleroderma, Goodpasture syndrome, Crohn's disease, rheumachid arthritis, autoimmune haemolytic anaemia, collising the collision's disease, scleroderma, Goodpasture syndrome, crohn's disease, rheumachid arthritis, autoimmune haemolytic anaemia, collision's disease, scleroderma, doodpasture syndrome, crohn's disease, collision's disease, scleroderma, doodpasture syndrome, crohn's disease, collision's disease, scleroderma, doodpasture syndrome, crohn's disease, scleroderma, doodpasture syndrome, anaemia, collision's disease, such disease, scleroderma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thromobenia burpura and insulin-dependent disbetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antibodies and proteins bind conserved epitope of Fas antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Jun O, Kimihisa I;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AAB14772-B14774 and AAB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains

apoptosis in cells with a normal system, by inhibiting binding between and its ligand. The products of the invention have anti-inflammatory, antidiabetic, anti-allergic, anti-arthritic, antidiabetic, anti-allergic, anti-arthritic, antidiabetic, antidiabetic, antialized cartivity. (I) induce antiarteriosclerotic, cardiant and hepatropic activity. (I) induce antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic unbibition of ligand binding. (I) are used to treat and/or prevent diseases, Sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, soleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminat, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of humanised anti-murine antibody response. This sequence represents a humanised anti-murine antibody response. This sequence represents and human anti-murine disease, and have reduced in humanised anti-murine antibody response. This sequence represents and human anti-murine disease, and have reduced risk of a humanised anti-pas antibody response. This sequence represents and human and murine Fas and have reduced risk of a humanised anti-pas antibody response. This sequence represents and human and murine Fas and have reduced in a humanised anti-pas and passed and passed and pass
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              121 TFGQGTKLEIKRTVAAPSVFIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQS 180

This is the amino acid sequence of the HM type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A. Humanisation of the murine sequence (see AAW83042) entabled making P47A and K49R amino acid substitutions; these residues are conserved in the human light (kappa) chain. Host cell E. coli pHSGHM17 SANK 73597 harbors plasmid pHSGHM17 carrying a fusion fragment of the humanised HW type HFE7A light chain and bNA encoding the region of human immunoglobulin kappa chain, and is methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal cells. The humanised of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal interactions, and also to treat such diseases, including autoinmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease, Sjogren syndrome, pernicious anaemia, addison's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, thrombopenia purpura and insulin-dependent diabetes), allergies, atophytistic anaemia, atophytistic anaemia, hepatitis, AHDS and transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, actory, arteriosclerosis, myocarditis, cardiomyopathy, allergy applayitis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. CC This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between ca apoptosis in cells with a normal system, by inhibiting binding between the staticiabetic, anti-antiria, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antirinenmatic, nephrotropic, antiinfertility, neuroprotective, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antirheumatic, nephrotropic, antiinfertility, neuroprotective, continent and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent capoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent capoptosis associated with the Fas/Fas ligand system, especially systemic upon synthematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Sigragen's syndrome, pernicious or hypoplastic versus host disease, Sigraferme, Syndrome, Cohn's disease, autering, arteriosciences, myocarditis, disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, is they minic the mative liquid anti-Fas antibody response. This sequence represents a human ised anti-Fas antibody response. This sequence represents a humanised anti-Fas antibody High A light chall have requesed in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

chain of murine anti-human Fas monoclonal antibody HFE7A. E. colicand of murine anti-human Fas monoclonal antibody HFE7A. E. colicand Navisor Alamid pHSGMMG carrying a fusion fragment of the humanised MM type HFE7A light chain and DNA encoding the region of humanised MM type HFE7A light chain and DNA encoding the region of humanised MM type HFE7A light chain and DNA encoding the region of humanised MM type HFE7A light chain and DNA encoding the region of humanised musticed for producing humanised antibodies by culturing host cells. Humanised oversions of HFE7A (see AAM83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune (disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atoppiration (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antibodies and proteins bind conserved epitope of Fas antigen

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Wis its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy glomerulonephitis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences ABB14772-B14774 and ABB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody .

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with a normal system, by inhibiting binding between apoptosis in cells with a normal system, by inhibiting binding between a sapoptosis in cells with a normal system, by inhibiting binding between a fast its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-alergic, anti-arthritic, antiviral, immunomodulatory, dermanological, immunomodulatory, dermanological, immunomosphessive, thyronimetic, antiarteriosolerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rhemmatoid arthritis, graft versus host disease, sjorgen's syndrome, pernicious or hypoplastic versus host disease, soleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephitis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection; (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic murine disease models. (I) act on the active site of Fas, i.e. they minic inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody HEPA light chain MM type which is used in the method described in the livention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

treating or preventing e.g. apoptosis selectively in

This invention describes a novel humanized anti-Fas antibody-like

reference 14; Page 119-120; 263pp; English

Example

New humanized anti-Fas antibody, useful for inflammatory or autoimmune disease, induces cells with abnormal Fas-Fas ligand systems

WPI; 2000-258930/23.

N-PSDB; AAA11564.

Sequence 15, Application US/09109207C
Patent No. 6172213
GENERAL INFORMATION
APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe
TITLE OF INVENTION: Improved Anti-IgE Antibodies and Method of Improving Polypept
FILLE REPRESENCE: P1123R
CURRENT APPLICATION NUMBER: US/09/109, 207C
CURRENT FILING DATE: 1998-06-30
                                                                                                      GENERAL INFORMATION:
APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe TITLE OF INVENTION: Improved Anti-1gE Antibodies and Method of TITLE OF INVENTION: Improving Polypeptides NUMBER OF SEQUENCES: 26 CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            121 IFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQSGNSQESVTEQDSKDSTYSLS 180

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Decided antibody 13-1 light chain - mouse monoclonal antibody 13-1 light chain - mouse class. Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Decides: Mus musculus (house mouse)
C;Accession: JG5810
C;Accession: JG5810
B;Akashi, S.; Kato, K.; Torizawa, T.; Dohmae, N.; Yamaguchi, H.; Kamachi, M.; Harada, B;Aritle: Structural characterization of mouse monoclonal antibody 13-1 against a porp A;Reference number: JG5810; MUID:98063277
A;Accession: JG5810
A;Molecule type: Protein
A;Recession: J-218 <ARA>
C;Comment: This catalytic antibody has peroxidase oxidase. It is directed against a pc;Superfamily: immunoglobulin V region; immunoglobulin homology
E;16-94/Domain: immunoglobulin homology <IMM>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A; Molecule type: mRNA

N

```
This is the amino acid sequence of the HV type humanised heavy chain of murine anti-human Fas monoclonal antibody HFE7A. It includes humanising R446 and A76T amino acid substitutions that are are conserved in the human igg heavy chain. Host Escherichia coli pgHPDHV3 SANK 70298 harbors plasmid pgHPDHV3 carrying a fusion fragment of the humanised HV type HFE7A heavy chain and DNA cancoding human iggl constant region (see AAV70080), and is deposited as FERM BP-6273 (citaimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells. The humanised antibodies are used to evaluate, in animal models, treatments of inducing ace to evaluate, in animal models, treatments of coliseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease, scleroderma, coopasture syndrome, pernicious anaemia, Addison's disease, scleroderma, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple scl rosis, Basedow's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis,

Humanised anti-Fas antibody heavy chain, SEQ ID NO:117. AAB14779 standard; Protein; 470 AA. 24-NOV-2000 (first entry) AAB14779; AAB14779

Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas Ilgand; apoptoals modulator; programmed cell death; autolimnune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephitis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; heavy chain.

- Mus musculus. JP2000169393-A. 20-JUN-2000 Chimeric Chimeric C

98JP-0276883. (SANY) SANKYO CO LTD. WPI; 2000-485645/43. N-PSDB; AAA72184. 30-SEP-1998;

99JP-0278301.

30-SEP-1999;

Preventive or treating agent for the diseases caused by an abnormality the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody

Claim 21; Page 108-109; 139pp; Japanese.

containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFE7A, or a humanised version of HFE7A containing identical CDRs (complementarity determining regions) to antibody HFE7A. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system

This invention describes a novel humanized anti-Fas antibody-like

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

ligand system, by binding to Fas on the cell surface, and prevents

competosis in cells with a normal system, by inhibiting binding between

ca apoptosis in cells with a normal system, by inhibiting binding between

ca midiabatic, anti-allergic, anti-arthritic, antivural,

immunomodulatory, dermatological, immunosuppressive, thyromimetic,

contineumatic, nephrotropic, antiinfertility, neuroprotective,

continity in cell surface Fas or inhibit it by competitive

antiarteriosclerotic, cardiant and hepatropic activity. (I) induce

antiarteriosclerotic, cardiant and hepatropic activity. (I) induce

continity in of ligand binding (I) are used to treat and/or prevent

continity in the Fas/Fas ligand system, especially systemic

clipsases associated with the Fas/Fas ligand system, especially systemic

clipsases associated with the Fas/Fas ligand system, especially systemic

clipsases associated system, especially systemic

clipsases, solorgemic, serificate syndrome, Crohn's

clipsase, autoinmune hemolytic anemia, sterility, myasthenia gravis,

cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral

cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral

cells. They bind to both human and murine Fas, so can be evaluated in

cells. They bind to both human and murine Fas, so can be evaluated in

cells. They bind to both human and murine Fas, so can be evaluated in

cells. They bind to both human and murine Fas, so can be evaluated in

cells. They bind to both human and murine Fas, so can be evaluated in

cells. They bind to both human and murine Fas, so can be evaluated in

cells. They bind to both human and murine Fas, so can be evaluated in

chancing a human anti-murine antibody response. This sequence represents

can and described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel humanized anti-Fas antibody-like molecule (1) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunoamodulatory demantological, immunosuppressive, thyromimetic, antirheumatic, nephrotropic, antinfertility, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g e.g.

versus host disease, Sjorgen's syndrome, pernicious or hypopiastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, mysathenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu I which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fas; antibody; human; anti-inflammatory; anti-anemic; antidiabetic; anti-allegic; anti-artific; antiviral; immunodulatory; caddiant; dermatological; immunosuppressive; thyrominetic; antirheumatic; anti-Fas; nephrotropic; antilnfertility; neuroprotective; antiarteriosclerotic; hepatotropic; humanized; apoptosis; systemic lupus erythematosus; Hashimoto disease; rheumatoid arthritis; graft versus host disease; Sjorgen's syndrome; anemia; Addison's disease; scleroderma; sterility;
